Feature Prioritization Framework — RICE Scoring Model

Author: Nalini Bose

Department: Product

Last Updated: 2026-03-28

Classification: internal

NovaTech's Product team uses a RICE scoring model (Reach × Impact × Confidence / Effort) to prioritise the feature backlog. This document defines the scoring rubric, governance process, and Q2/Q3 2026 prioritisation outcomes. Feature X received the highest RICE score in the Q3 cycle (score: 84), ahead of the Slack Integration (score: 71) and EU Data Residency (score: 68).

1. RICE Scoring Rubric

Dimension	Definition	Scale
Reach	# customers affected per quarter	1–1000
Impact	Improvement to key metric (revenue/NPS)	0.25/0.5/1/2/3
Confidence	Evidence strength for estimates	20%/50%/80%/100%
Effort	Person-months of engineering work	0.5–12

2. Q3 2026 Feature Scores

Feature	Reach	Impact	Conf.	Effort	RICE
Feature X	450	2	80%	8.5	84
Slack Integration	380	1	80%	4	71
EU Residency	200	3	80%	7	68
Analytics Dash	600	1	100%	6	100
Custom Embeddings	120	2	50%	7	17

3. Governance Process

RICE scores are recalculated at the start of each quarter in a 2-hour Product Council meeting attended by the CPO, VPs of Engineering and Sales, and the Head of Customer Success. Scores above 50 automatically enter the roadmap; scores 30–50 are reviewed case-by-case; scores below 30 are parked in the idea backlog.
